Vladislav Panchishnyi

Python Developer Intern candidate, EPAM Campus

panchushnui@gmail.com · Telegram: @carlospertan · github.com/FraklinSaint · Kyiv, Ukraine

Summary

Python developer who builds and ships products end to end. I founded and develop FacePeak, an AI face-analysis platform with a web app and a Telegram bot, covering backend, data storage, deployment and payment flows. I have also built SafeDeal, an escrow platform on Solana, and CONSTITUTION, a Solana security protocol submitted to the Alliance accelerator. I am looking for an internship at EPAM to grow inside a professional engineering team.

Technical skills

- **Languages:** Python, TypeScript, Rust, SQL
- **Backend:** Python backend services and APIs, Telegram Bot API, rate limiting, payment flows
- **Data and storage:** PostgreSQL, Cloudflare D1, Cloudflare R2
- **Deployment:** Railway, Vercel, Git/GitHub
- **Blockchain:** Solana, Anchor Framework, Rust smart contracts, USDC escrow logic
- **Frontend:** HTML, CSS, React
- **Practices:** testing, deployment, AI-assisted development

Projects

FacePeak, founder and lead developer · Telegram bot

AI platform that analyzes facial aesthetics from a photo: it scores symmetry, proportions and harmony, shows the measurements and gives personal recommendations. Available as a web app and a Telegram bot.

- Designed the product architecture and built the Python backend integrations
- Built the Telegram bot and payment flows
- Implemented data storage, rate limiting and account deletion
- Handled testing, deployment, product decisions and marketing

Stack: Python, PostgreSQL, Cloudflare R2, Railway, Vercel, Telegram Bot API, AI development tools

SafeDeal, developer · Demo

Decentralized P2P platform for safe deals on the Solana blockchain. The buyer locks USDC in an escrow contract and the funds go to the seller after the deal is confirmed; in a dispute the funds stay locked under the contract logic. Integrated with Telegram.

- Worked on application architecture and the Solana integration
- Implemented the escrow deal logic
- Built frontend components, user profiles and ratings
- Set up data storage and the Telegram integration

Stack: TypeScript, Solana, Rust, Anchor Framework, React, Cloudflare D1, SQL, Vercel, Telegram Bot API

CONSTITUTION, developer · Demo and source

Security protocol for Solana that protects DeFi protocols from dangerous changes to admin parameters. Critical changes go through a public delay, so users have time to spot risky actions before they execute. Submitted to the Alliance accelerator.

- Designed and built the on-chain security logic and the delayed-execution mechanism
- Added limits on vault and fund-distribution operations

Stack: Rust, Solana, Anchor Framework, smart contracts

Education

Kyiv National Economic University named after Vadym Hetman (KNEU), 2nd-year student

Languages and additional

- English: B2
- Polish: B1
- Ukrainian, Russian: native
- Achievement: 2nd place at a university vibeathon with the SafeDeal project
